

ENCS-3m ENCM-3

remote terminal units

ENCS-3m and ENCM-3 remote terminal units (RTUs) provide a data communication channel between power facilities and control centers.

ENCM-3 is equipped with four interfaces, digital and analog inputs and outputs, and is used for automation of 6-20 kV substations and switchgear in distribution networks.

ENCS-3m are equipped with up to 14 interfaces and are used in automation systems of power plants and substations.

The RTUs function in real-time, acquiring data from up to 240 devices via RS-485, RS-232, and Ethernet interfaces. Collected data is aggregated and transmitted to automation systems with minimal delays.

The RTUs can be configured to perform logic operations and arithmetic calculations with the values collected.

Multiple proprietary and standard communication protocols are supported, including IEC 61850-8-1 (client/server, MMS/GOOSE). The RTUs act as protocol converters, and by demand can tunnel serial interfaces, providing direct access to devices connected to their RS-232/485 ports.

Modifications with a built-in GPS/GLONASS receiver and a 3G/2G module are available.

ENCM-3

Remote terminal unit is equipped with three serial ports and one Ethernet port.

ENCM-3 supports data transmission in cellular networks and receives GPS/GLONASS signals.

ENCS-3m-...-1, ENCS-3m-...-2

Remote terminal unit has ten asynchronous serial ports, and two or four Ethernet ports. This modification is distinguished by the presence of a CAN, which is used for the “warm” standby mode. It can be ordered with options: G – 4G/3G/2G module, GT – ... + GPS/GLONASS module.

ENCS-3m-...-3, ENCS-3m-...-4, ENCS-3m-...-5

Remote terminal unit has ten asynchronous serial ports, and four Ethernet ports supporting RSTP and PRP redundancy in accordance with IEC 62439-3.
